

Energy is the underlying existence showing as changes through the changes in time, and as infinite and undivided through the smallness and dispersion of the particles ⁱⁿ through space.

The universe is made out of hydrogen. The changes show through as its inertia. The infinite shows through as its electrical charge. And the undivided shows through as gravity and the attraction between opposites (like plus and minus; spin-up and spin-down).

Gravity falls the hydrogen together to galaxies and stars, and the entropy goes up. But only living organisms notice it.

The sentience of protons and electrons is particles by particle. They discriminate protons, electrons, neutrons, spin-up, spin-down, gravity, electricity and inertia. They do not discriminate entropy, and their sentience is not removable. (Gravity knows nothing about planets and stars; it's particles by particle.)

The sentience of living organisms is organism by organism. They must discriminate negative entropy to stay alive, and their sentience is removable at death.
